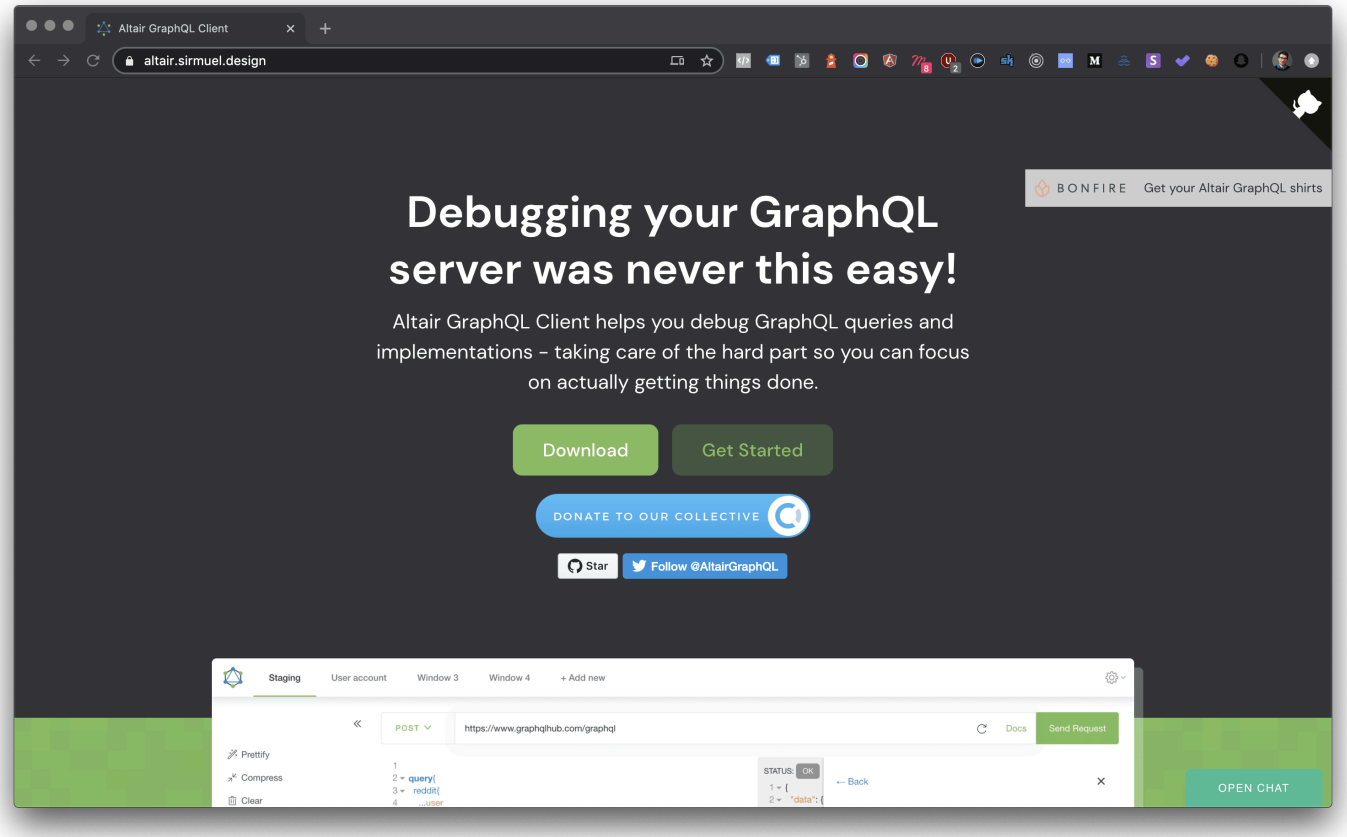
How to query your first data?

Know what you query

Basically, you can just get what you can query with the introspection request.

A good way to play with our graphQL API is to try it with Altair GraphQL Client.

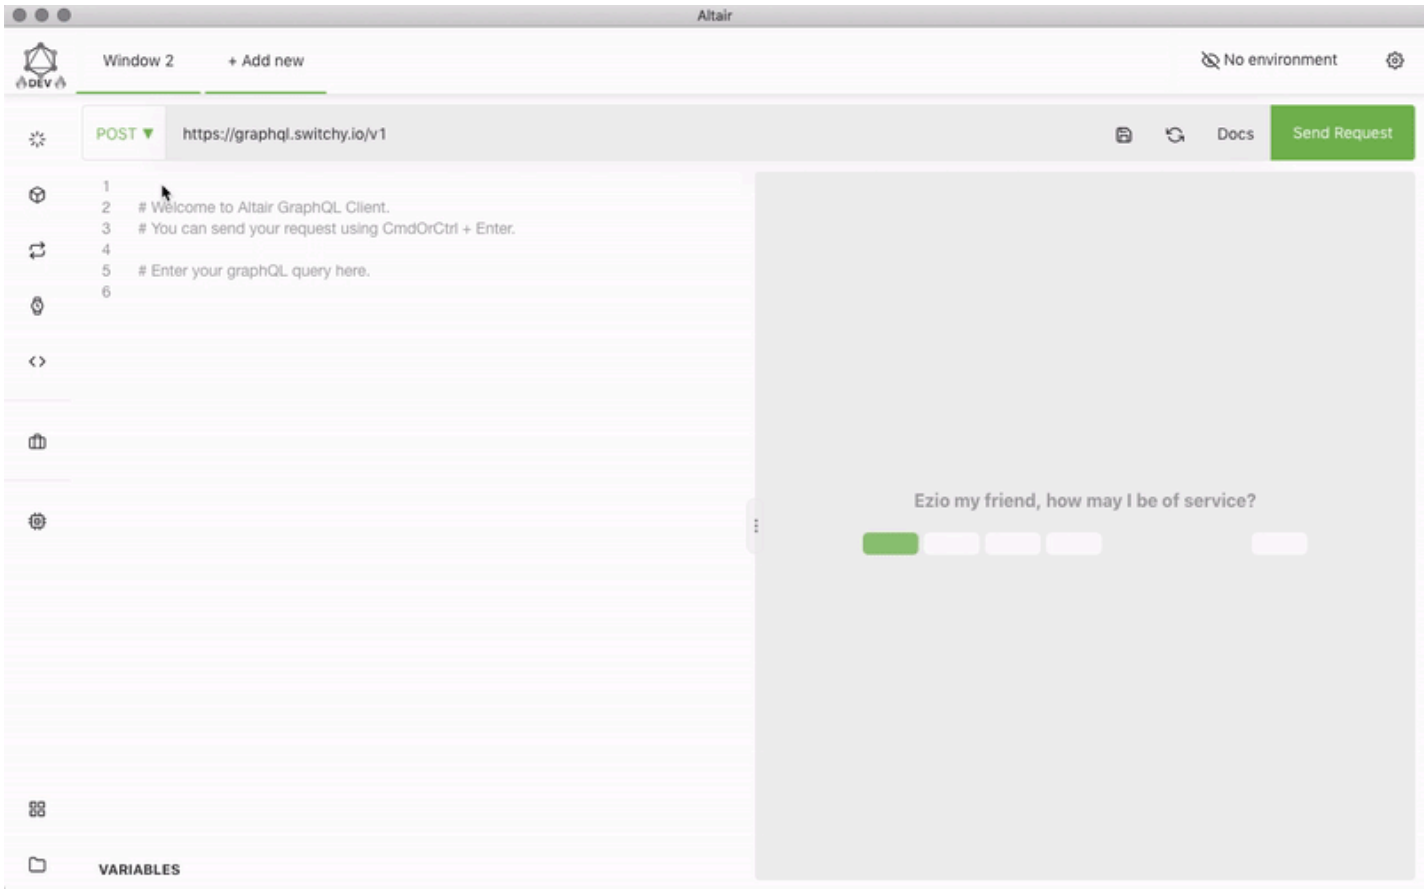


Tuto to use graphQL API with Altair GraphQL Client

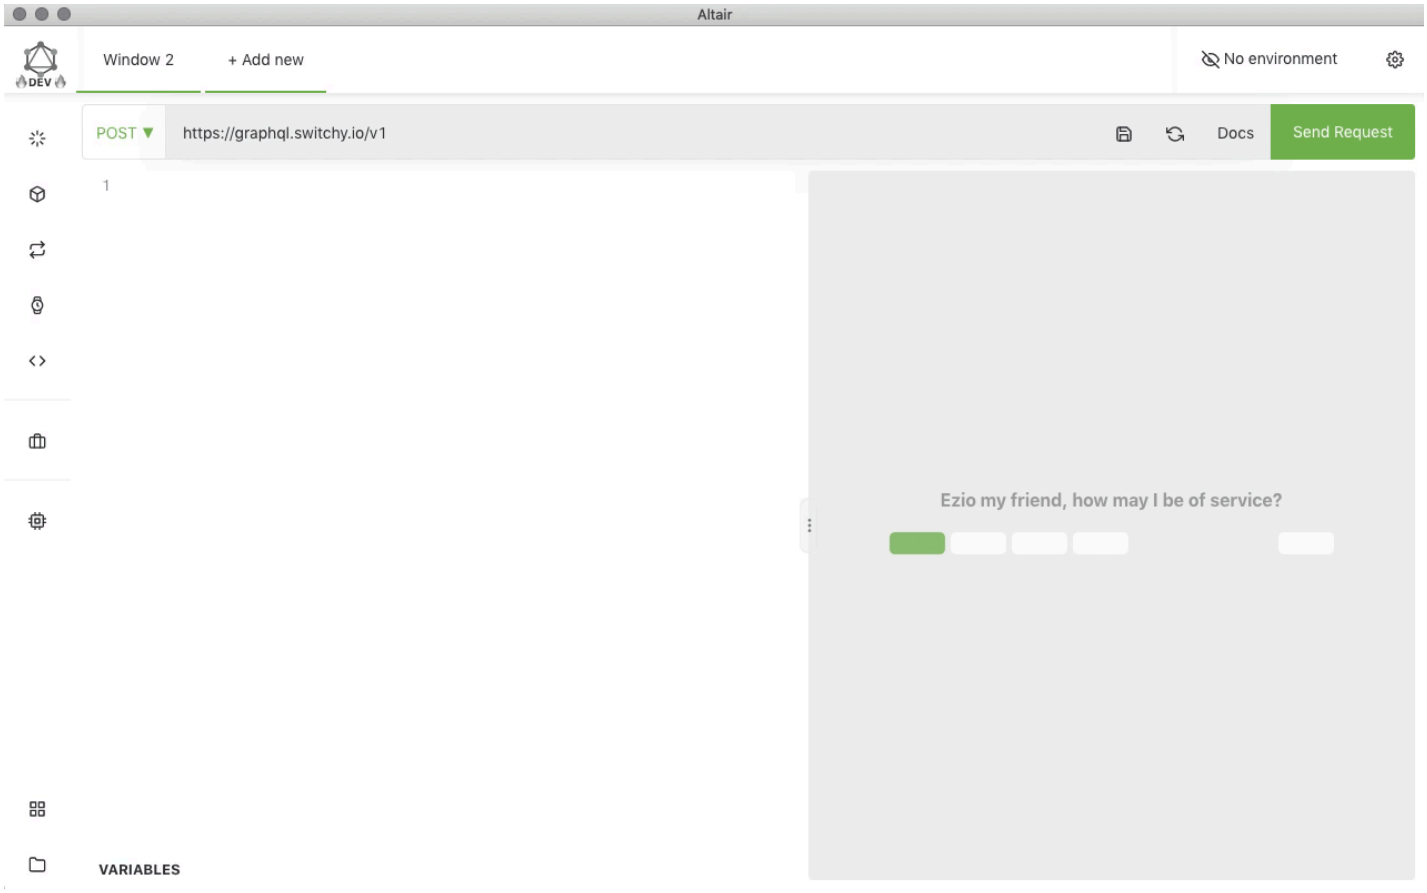
1. Download the software at https://altair.sirmuel.design/

2. Set the corresponding configuration :

- Setup the graphQL url (**https://graphql.switchy.io/v1/graphql**)
- Put the **Api-Authorization** header and put your corresponding **token**.
- Reload the docs, to have the graphQL schema corresponding to your access.



3. **(Optional but awesome)**, In the settings part, you can activate the experimental mode and add the **altair-graphql-plugin-graphql-explorer** plugin. It will allow you to write your graphQL queries and mutations with few clicks.



Get some datas corresponding to the token with one single query

```
query SomeDatas {
  workspaces {
    companyName
    activateRgpdEverywhere
    createdDate
    id
    name
  }
  domains(where: {removedDate: {_is_null: true}}) {
    createdDate
    name
  }
}
```
